## 1 Introduction

---

This document provides the way to perform *FUCHIKOMA* package. *FUCHIKOMA* is the method for detection of differentially expressed genes (DEGs) within single-cell RNA-Seq (scRNA-Seq) dataset.

## 2 Getting started

---

### 2.1 Package loading

To install the *FUCHIKOMA* package into your R environment, start R and enter:

```
> # source("http://bioconductor.org/biocLite.R")
> # biocLite("FUCHIKOMA")
```

And then load the *FUCHIKOMA* package.

```
> library("FUCHIKOMA")
```

### 2.2 Test data

For demonstration of *FUCHIKOMA*, we prepared MARS-Seq data [4], which is a

```
> data(MARS)
> data(label.MARS)
> data(result.pca.MARS)
> data(result.destiny.MARS)
```

### 2.3 Effectivity of non-linear dimentional reduction

```
> pairs(result.pca.MARS$rotation[, 1:10], col=label.MARS)
```

```
> pairs(result.destiny.MARS@eigenvectors[, 1:10], col=label.MARS)
```

## 2.4 Limitation of non-linear dimentional reduction

## 2.5 How to get help

All *FUCHIKOMA* questions should be posted to the Bioconductor support site: <https://support.bioconductor.org>, which serves as a repository of questions and answers. See the first question in the list of Frequently Asked Questions (Section 5) for more information about how to construct an informative post.

## 3 How to use FUCHIKOMA

---

### 3.1 FUCHIKOMA : Supervised mode (ANOVA-like)

### 3.2 FUCHIKOMA : Supervised mode (cluster specific DEGs)

### 3.3 FUCHIKOMA : Unsupervised mode

## 4 Setup

---

This vignette was built on:

```
> toLatex(sessionInfo())
```
